Summary

My interest is to understand how we learn abstract concepts to solve new problems quickly and when these internal models fail. Currently, I am developing vision-text deep learning models that learn visuo-language concepts for human-like reasoning. My PhD work has been to develop biologically plausible spatial navigation reinforcement learning models to replicate one-shot learning behavior seen in animals. Prior to my PhD, I worked with human EEG and macaque spike data to develop Human-Computer Interfaces for wheelchair control. My aspiration is to improve biological and artificial intelligence to solve problems in biomedical sciences and robotics.
