Summary

My interest is to understand how we learn world models to solve new problems quickly and when these models fail. My PhD work has been to develop biologically plausible spatial navigation reinforcement learning models to replicate one-shot learning behavior seen in animals. Prior to my PhD, I worked with human EEG and macaque spike data to develop Human-Computer Interfaces for wheelchair control. Currently, I am involved in computer vision projects for visual reasoning. My aspiration is to develop HCI technologies that can improve learning outcomes and alleviate learning disabilities posed by mental disorders.
